

# Air Quality Index (AQI) Analysis of Indian Cities

## 1. Project Overview

Air pollution is a major environmental and public health challenge in India. This project analyzes **city-level air quality data** to understand pollution patterns, seasonal trends, city-wise disparities, and associated health risks.

The analysis combines **Python-based Exploratory Data Analysis (EDA)** with **interactive dashboards (Power BI)** to deliver both analytical depth and business-ready insights.

### Objectives

- Analyze AQI trends over time (daily, monthly, yearly)
- Identify the most and least polluted cities
- Understand seasonal patterns in air pollution
- Assess health risk exposure across cities
- Create decision-ready dashboards for comparison and ranking

---

## 2. Dataset Summary

### Dataset Source

- File: `city_day_air_quality.csv`
- Granularity: **Daily city-level air quality records**
- Coverage: **26 Indian cities**
- Time Period: **2015 – 2020**

### Key Features

| Category       | Columns   |
|----------------|---|
| Location       | City  |
| Time           | Date, Year, Month   |
| Pollutants     | PM2.5, PM10, NO, NO2, NOx, NH3, CO, SO2, O3, Benzene, Toluene |
| Target Metrics | AQI, AQI_Bucket   |

### Dataset Shape

- Rows: **29,531**
  - Columns (final): **19**
-

### 3. Data Preprocessing & Cleaning

#### Steps Performed

- Converted Date column to datetime format
- Extracted Year and Month for time-series analysis
- Removed high-missing column (Xylene)
- Imputed missing pollutant values using:
  - City-wise median
  - Global median (fallback)

#### AQI Reconstruction

- Computed **pollutant sub-indices** using **CPCB-defined breakpoints**
- Used **linear interpolation** within breakpoint ranges
- Final AQI computed as the **maximum sub-index** across pollutants
- Missing AQI values filled using calculated AQI

#### AQI Bucketing (CPCB Standard)

- Good (0–50)
  - Satisfactory (51–100)
  - Moderate (101–200)
  - Poor (201–300)
  - Very Poor (301–400)
  - Severe (400+)
- 

### 4. Exploratory Data Analysis (EDA)

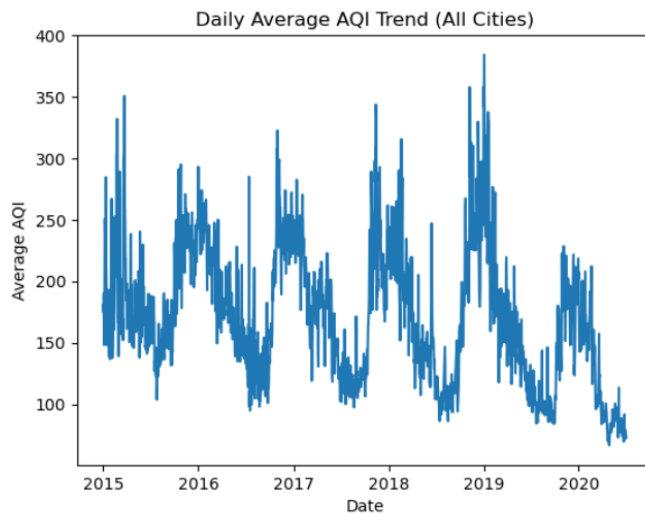

#### 4.1 Overall AQI Statistics

- Mean AQI: **~166**
  - Median AQI: **118**
  - Indicates majority of days fall in **Moderate** category
- 

#### 4.2 Daily AQI Trend (All Cities)

- High volatility across years
- Extreme spikes observed in northern cities
- Indicates episodic pollution events

**Insight:** Air quality fluctuates sharply day-to-day, especially during winter months.

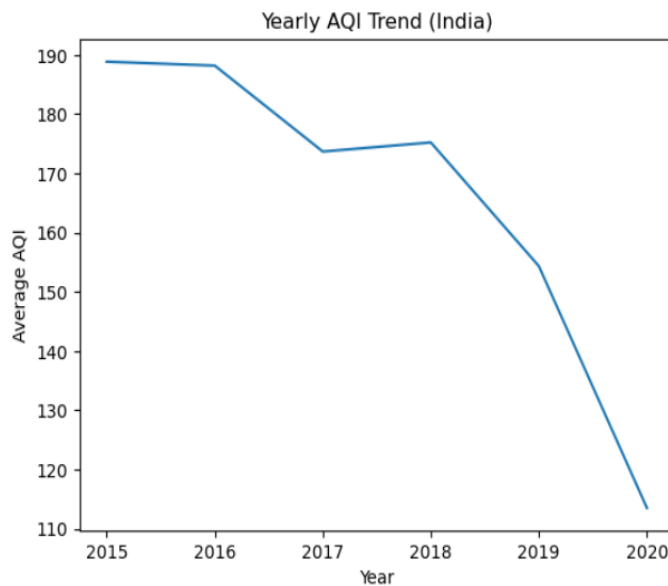

---

### 4.3 Yearly AQI Trend (India)

- Overall declining trend from **2015 to 2020**
- Significant improvement after **2018**

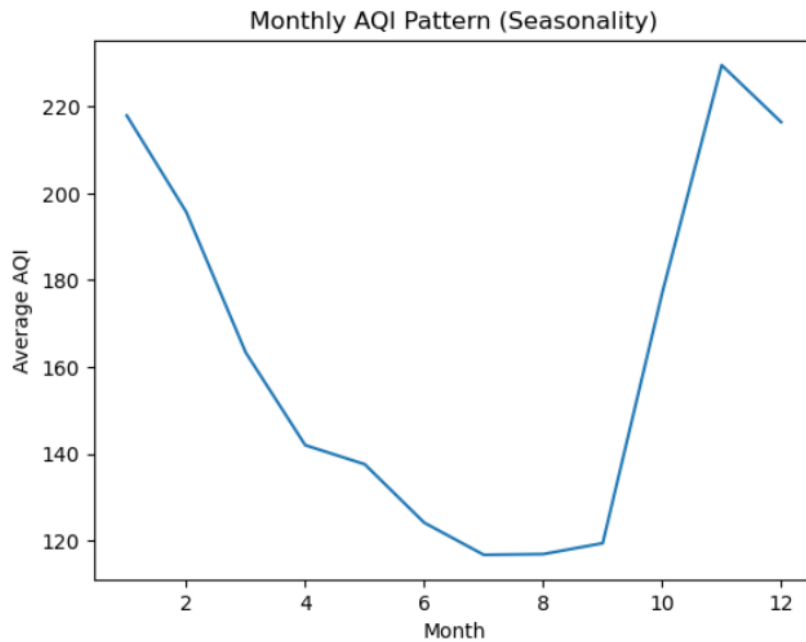

**Insight:** National-level air quality shows gradual improvement, possibly due to policy interventions.

#### 4.4 Monthly AQI Pattern (Seasonality)

- Worst AQI: **November – January**
- Best AQI: **July – August (Monsoon)**

**Insight:** Strong seasonal dependency driven by weather, crop burning, and emissions.

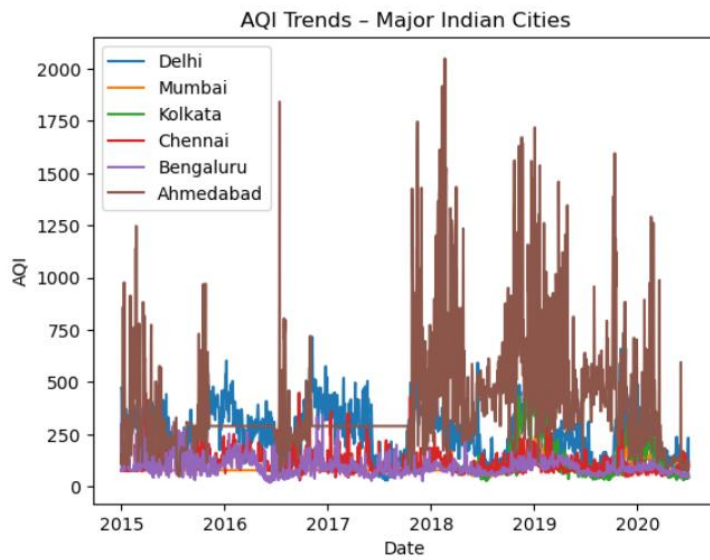

---

#### 4.5 City-wise AQI Trends (Major Cities)

Cities Analyzed: - Delhi - Mumbai - Kolkata - Chennai - Bengaluru - Ahmedabad

**Observations:** - Ahmedabad & Delhi show extreme volatility - Coastal cities (Mumbai, Chennai) maintain relatively stable AQI

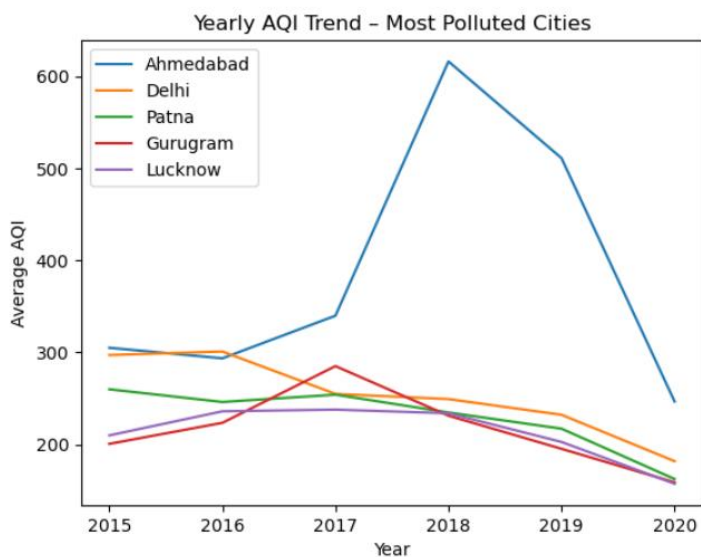

---

#### 4.6 Most Polluted Cities (Average AQI)

Top contributors: 1. Ahmedabad 2. Delhi 3. Patna 4. Gurugram 5. Lucknow

**Insight:** Inland and northern cities dominate pollution rankings.

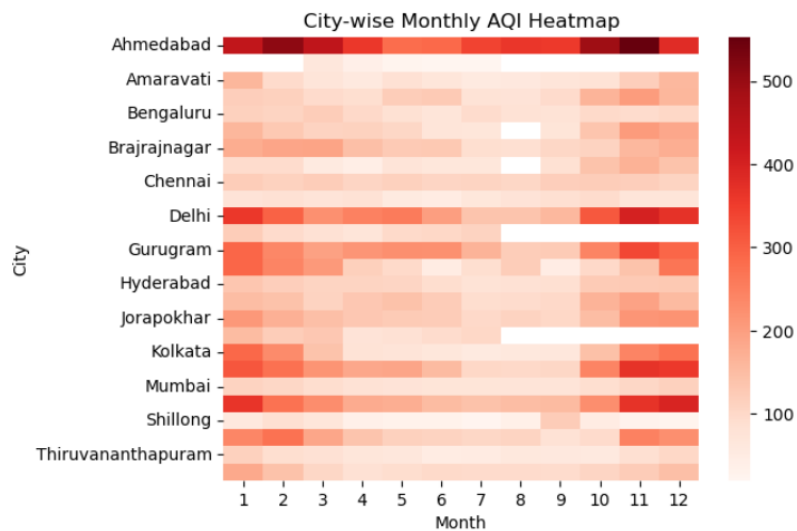

---

#### 4.7 City-wise Monthly AQI Heatmap

- Northern cities show intense winter pollution
- Southern & coastal cities show moderate seasonality

**Insight:** Geography and climate strongly influence AQI behavior.

---

## 5. Health Risk Analysis

### AQI Category Distribution (%)

- Moderate: **34.4%**
- Satisfactory: **34.0%**
- Poor or Worse: **~26%**

### High-Risk Exposure (Poor + Very Poor + Severe)

- Ahmedabad: Highest number of high-risk days
- Delhi & Patna follow closely

**Public Health Insight:** Even a small percentage of Severe AQI days poses serious health risks.

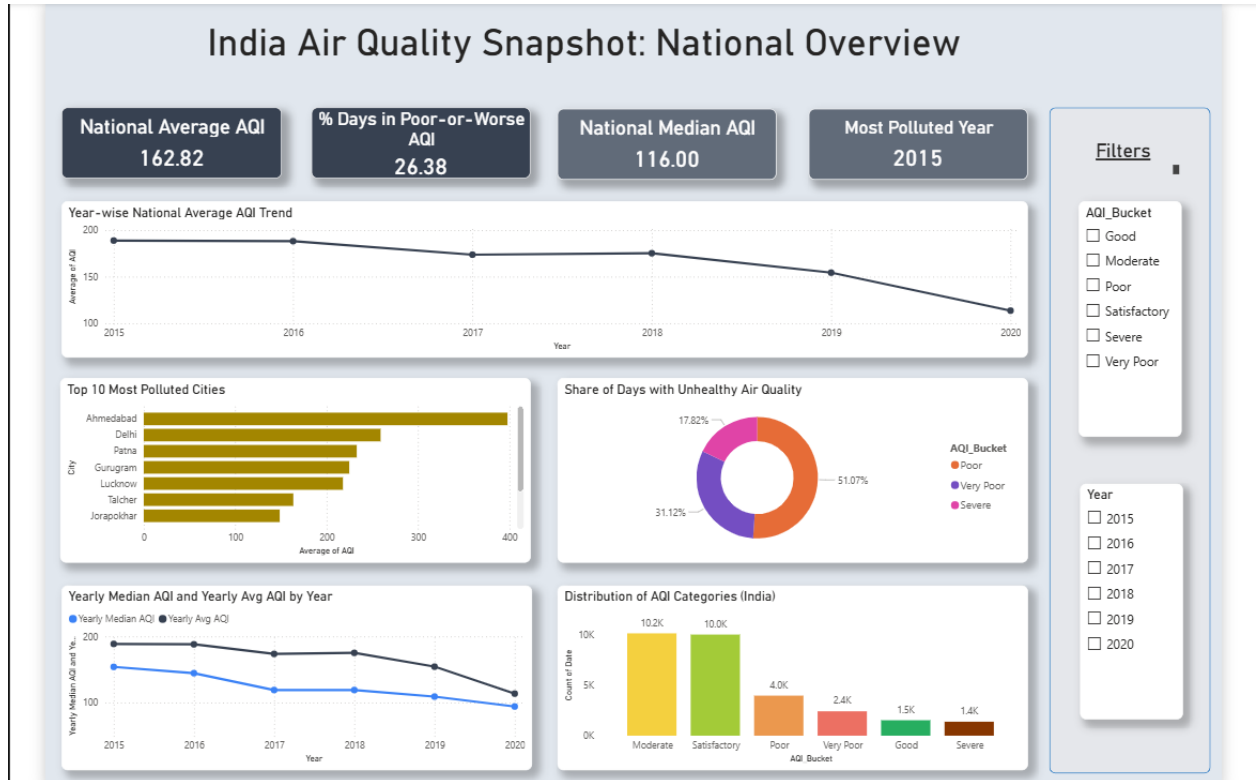

---

## 6. Dashboard Integration (Power BI)

### Dashboard 1: National AQI Overview

- AQI distribution
- Yearly & monthly trends

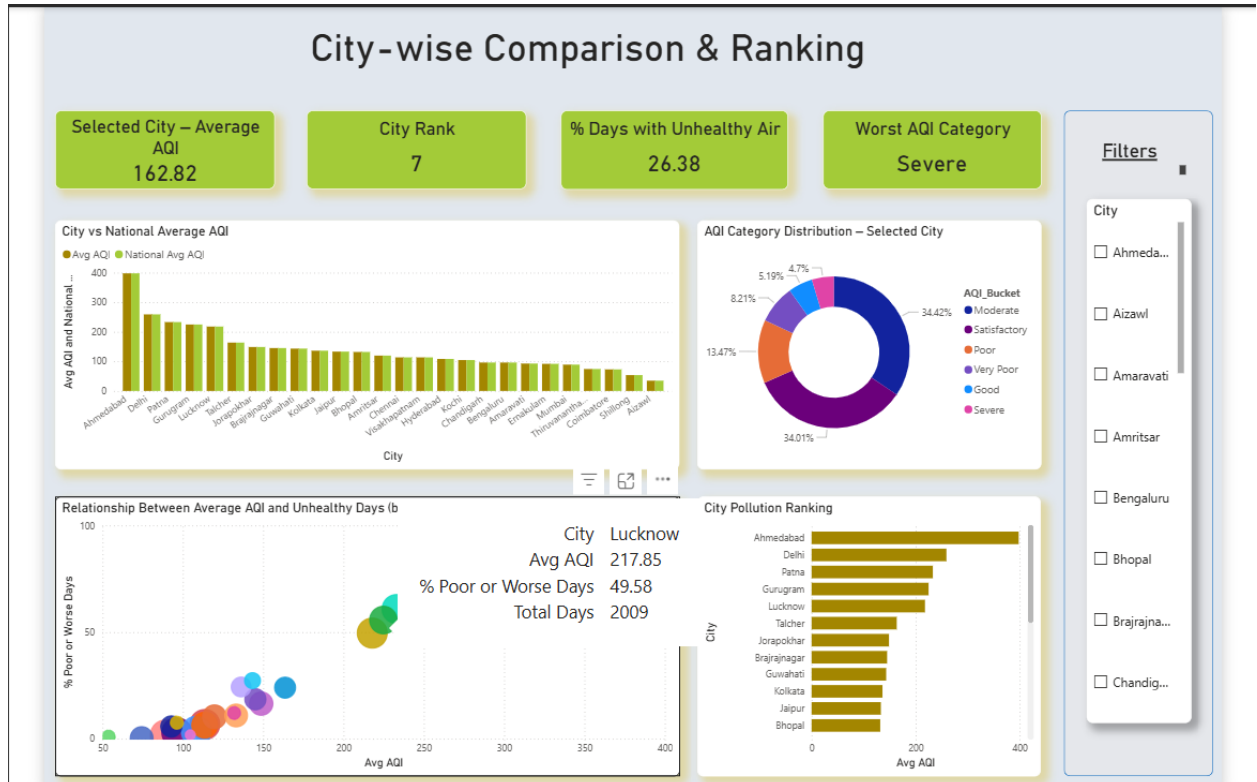

- National health risk exposure

## Dashboard 2: City-wise Comparison & Ranking

- City AQI ranking
- City vs national average
- % unhealthy days

- Worst AQI category (KPI-driven)

## 7. Key Insights & Conclusion

- Air pollution in India is **highly seasonal and location-dependent**
- Northern inland cities face **persistent and severe pollution**
- National AQI shows **gradual improvement**, but city-level risks remain
- Data-driven dashboards enable **targeted policy and health planning**

## 8. Tools & Technologies Used

- **Python:** Pandas, Matplotlib, Seaborn
- **Power BI:** Interactive dashboards, DAX measures
- **Statistical Methods:** Median imputation, ranking, correlation

## 9. Future Scope

- Predictive AQI modeling (ML)
- Policy impact analysis
- Integration with weather data
- Real-time AQI monitoring dashboards
